

A seminar “Trouble Shooting and Repair of your Propane Appliances” was presented at the recent International Convention/Rally. There is an error in the Refrigerator troubleshooting section. It should read as follows:

Fridge not cold freezer OK

1. On units with fins check the location of the thermistor on the fridge internal fins at the rear top of the main food box. The vertical position of this thermistor allows the temperature of the box to be changed. Just move this up to decrease the box temperature (make the fridge colder) and conversely if the food is too cold, move it down. Do this in small increments with a thermometer in the box. This actually allows you to balance the freezer/food compartment temperatures.
