

I am parked at a Campground for a couple of months and have full hook-ups. Can I just leave my dump valves open? I really don't want to worry about dumping the tanks.

NEVER leave your black water holding tank dump valve OPEN! Dumping the black tank and flushing solids out of your holding tank requires a large amount of fluid in order to get all of the solids from the tank. Leaving the black water dump valve open will lead to a holding tank that will be plugged up in short order!

After tank has been emptied, start with approximately a 1/8 of a tank of water in the tank along with chemicals (or equivalent) to help break down the solids. You may want to start collecting some gray water by closing the dump valve to help clean out the plumbing when black tank is getting $\frac{3}{4}$ full and dump the gray tank after you have dumped the black tank.
