

## Ed's awning Tensioner

Ed Hemmingson of Albany, Oregon, has come up with a device that he is making to help set the rafter arms on your Zip Dee awning; it requires less effort (for older people like me) than doing conventionally. He feels that you can actually apply more tension than you would be able to do manually thus making the awning work better (keeps fabric tighter).

The one end of the device slips over the aluminum bar and the other end fits against the square tube; pull the handle toward you and you are applying tension to the awning. A couple pulls and you are done. Ed makes this himself and has applied for a patent; so if you are interested give Ed a call at 541 926 7070.
